General Comment

Generative AI, as it currently stands, has been a disaster in almost every creative field I've seen it implemented in. I'm an independent artist and it's been demoralizing to watch jobs that used to be stepping stones to further opportunity vanish, with the added insult of it being done by stealing the work of peers in the field without compensation or even attribution. Those making money off of these products are the ones who've created a class of middlemen.

Deregulating it and allowing these models to stand as they are will not, based on my observations, help anyone but the already wealthy. Current models contain data that was harvested without considerations for individual's intellectual property, and, even worse, their privacy. It and it seems very short sighted to allow these models to use this data unchecked. There's already been more examples than I can count of egregious violations towards people using these models and that's with the very minimal checks it already has on it. In many ways, it's very difficult to fully articulate the harms because the models themselves are so opaque.

I don't think there are no upsides to generative AI, but there needs to be more care and consideration put into its future applications than we're seeing from the current loudest voices demanding it be able to grow unfettered and carelessly disrupt every industry they can wedge it into so that they can make their quarterly numbers go up.
