General Comment

Most of what is commonly referred to as "AI" is simply the use of Large Language Models. These algorithms do not involve intelligence per se, but simply predict the most likely set of words that are found in connection with the keyword. We have seen many examples of incorrect information being provided by "AI" in response to questions, and it would be foolish and dangerous to use these models to provide assistance or to evaluate claims (such as disability applications) as the science currently stands. It is also immoral and a theft of intellectual property that the AI community has trained its models by scraping other people's words and images from the internet. Couple this with the huge power requirements involved in running these models, and the massive government subsidies, both direct (funding) and indirect (requiring their use), and we run the risk of actual harm to our institutions and our citizenry if we allow agencies to implement AI without clear guardrails. At a minimum, any agency/department/office that proposes to use AI should be required to maintain full, pre-2025 levels of employment and have every AI response and recommendation for action fall under human review for a period of no less than 2 years. Prior to the implementation of AI, a metric for success/failure should be established, indicating the level of AI mischaracterizations/failures that will be deemed acceptable. Finally, for any agency/department/office that uses AI, there must be a well-publicized non-AI route for appeal of decisions, with those appeals being heard in an expedited fashion.
