General Comment

I believe, given the past half-decade of what AI technology has brought us, AI as an industry would be better off regulated. 'Burdensome regulation,' as mentioned in the document, would imply that the EO would seek to upend the very policies keeping the tech industry in check and retaining organic labor in the economy. If left unchecked, we could potentially see a rise in unemployment and income disparity if this all leads to companies replacing its own organic labor with AI, as a lot of companies would very likely see this as an opportunity to maximize their profits. I've seen this happen left-and-right, especially with creatives which already struggle to find opportunity because companies would rather put some words in a prompt generator to make an AI-generated picture, moving or not, so they wouldn't have to pay their own workers for some soulless inorganic slop. All I ask is for the government to reconsider its stance on certain AI technologies which are already doing more harm than good in some industries and take a more sensible approach. I believe part of America's beauty is in its organic workforce and I would like for it to stay that way.
