## Submitter Information

**Name:** Wes Selken

[REDACTED]

---

## General Comment

I've attached a list of AI's potential impact and list of Policy Consideration that I would like you to consider when developing your ai action plan.

1. AI has the potential of Disrupting or Replacing Up to 60% of U.S. Jobs

AI has the potential to automate tasks across industries, leading to widespread displacement in sectors like transportation, customer service, manufacturing, and even white-collar professions like legal research, software development, and accounting. While automation can increase productivity and profits, it risks concentrating wealth among AI stakeholders while displacing millions of workers.

Policy Considerations:

Establish a national AI Economic Impact Task Force to analyze automation risks in real time.

Require companies implementing AI-driven automation to report expected job losses and fund worker retraining programs.

Develop AI taxation models where companies benefiting from automation contribute to workforce transition programs.

2. AI is currently being developed and controlled by a small group of large tech companies. If left unchecked, the wealth generated by AI could flow primarily to these corporations, widening economic inequality. Ensuring AI serves the broader public interest requires policy intervention.

Policy Considerations:

AI Dividend or Automation Tax: Large-scale AI adopters should contribute to a public fund used for education, healthcare, and job training.

Public AI Models: Promote open-source AI initiatives and government-led AI research to ensure broader access and prevent monopolization.

Worker Equity in AI Companies: Encourage companies to offer profit-sharing models where workers displaced by AI receive a share of AI-driven gains.

Community AI Grants: Allocate funding for local AI-driven projects that benefit underserved communities, such as AI-powered healthcare diagnostics in rural areas.

3. As AI systems increase productivity without direct human labor, the traditional link between work and financial well-being is weakening. Without proactive measures, this could result in mass unemployment, stagnant wages, and a decline in overall quality of life.

Policy Considerations:

Universal Basic Income (UBI) or AI-Generated Revenue Redistribution: If AI can generate massive productivity gains, a portion of its profits should fund direct financial support for displaced workers.

Shorter Work Weeks: Consider reducing work hours while maintaining wages, allowing AI to supplement human labor instead of replacing it.

Public Sector AI Projects: Use AI to improve government services, from education to infrastructure, creating new public-sector jobs.

Healthcare and Mental Health Support: AI-driven job loss could increase stress and economic instability, requiring expanded support for affected workers.

4. While AI will eliminate some jobs, it will also create new ones. The challenge is ensuring workers are retrained quickly enough to transition into these new roles.

Policy Considerations:

National AI Workforce Training Initiative: A government-led program that provides free or subsidized retraining for workers in AI-impacted industries.

Employer Incentives for Retraining: Provide tax credits or subsidies to companies that reskill workers instead of replacing them with AI.

AI-Powered Career Guidance Tools: Use AI to match workers with retraining opportunities based on their skills and job market trends.

Apprenticeship Programs in AI Fields: Partner with tech companies to create hands-on AI and automation training programs.

5. AI models are often trained on copyrighted materials without direct compensation to the original creators. Writers, artists, musicians, and other content creators are losing revenue as AI generates content based on their work.

Policy Considerations:

AI Training Royalties: Require AI companies to pay copyright holders when their work is used for AI training.

AI Transparency Laws: Require AI companies to disclose what data is used in training and provide an audit trail for copyrighted content.

Creator Revenue-Sharing Models: Platforms that host AI-generated content should allocate a percentage of earnings to the original content creators.
