General Comment

Generative Artificial Intelligence has no material gain in terms of defense.

Generating text or images based on stolen materials does not have military benefit.

AI in this form weakens copywrite law in the US and abroad, stealing data training sets is still stealing. As the US has utterly failed it's manufacturing industries the only remaining exports it has are intellectual, removing that possible export guarantees economic collapse when there is nothing left to sell.

Allowing companies to use licensed materials for generation of tools means that as long as a company puts "AI" somewhere in their terms they would have the right to steal and use any software, images, videos, or text they want.

Generative AI has already been shown to be disliked by consumers. The recommended searches surrounding generative AI or "copilot" features are asking how to disable them. Windows 11 is losing market value to Windows 10 in part due to AI features along with Microsoft reducing the number of leases it had in place for servers capable of generative AI. Apple has also reduced it's goals for generative AI after seeing market reaction.

Generative AI would drive up power costs in a country with an already pitiful power grid, take away opportunities from businesses and citizens alike, eventually crash the market for no gain, and has no military benefit.
