General Comment

Development of an artificial intelligence action plan? That sounds like what might be one of the single worst ideas possible currently. One; it is known and documented that the current ai engines will search and scrape everything and anything they possibly can from the internet with or without consent from the users. Two; from all the various information this will likely be significantly more costly and wasteful than one could even imagine as the ai tries to parse not just the information, but also the intentionally poisoned information that people would feed into it, causing the whole system to not only be incomprehensible but potentially dangerous to everything if actually put into any form of action. Three; allowing this to go through would potentially cause an even bigger economical crash than one could predict as this could cause irreparable harm to anything that can be considered creative or even pivotal as all this would cause is people to just not be creative, inventive, nor try and problem solve, creating a potential death spiral for all of America as this would just further worsen our already terrible situation and be a potential final death nail, as then these companies would also have to try and compete with less than friendly places like China and Russia who would gladly take all of this data for themselves by forcing it out of the tech industry that tries to set up in their regions.
