Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-5567

Comment on FR Doc # 2025-02305

Submitter Information

Name: Jillian Sauers

Address: United States,

Email: [REDACTED]

General Comment

Artificial intelligence usage has many harmful things attached to it, and it should not be applied in government decision making processes or databases, and should be restricted for the following reasons:

Intellectual property theft. Scraping the internet for collected films, art, and books is a nightmare for companies that sell creative products as well as the creators who produce them. If a model can spit out a slightly tweaked copy of a Disney movie, Disney's value plummets. Plus the quality of what it produces is so much worse like if dust gets into your copier all those bits of dirt wind up showing in the final product.

It makes us less intelligent. From term papers to lawsuits, glaring errors have been published in humiliating ways showing the students or lawyers in question took a cheater's shortcut using ChatGPT and it made facts, citations, and lawsuits up out of whole cloth. That is unacceptable in most lines of work and can cause literal deaths if misapplied in high stakes trials. It prevents true learning and thinking your way through problems.

It is disastrous for the environment. The chips and power center usage it goes through are unbelievable and will hasten climate change.

It takes people's jobs and overworks the ones who aren't laid off. You may think you're saving a 100k laying off a copywriter or ad exec but the quality it produces is not of the same caliber as human work and many people are disgusted by that kind of laziness and choose to boycott companies that use it. Look at the recent Tesla dealership on Mars art slop that couldn't even spell the company's name right. A normal ad agency would be fired on the spot if that was released. A human would need to manually fix it, causing more work than if you had just paid someone to do the work correctly in the first place.

It is expensive. The companies only survive on venture capital funding rounds, not paying customers. It costs more to plug it into everyone's everyday life than the return on the investment. The product is not good enough to warrant the buy-in.

AI may have possible applications in the future and more research at an academic level with controlled studies may be warranted, but it has no place in databases, courts, or where people's lives and paychecks are at stake in its current iteration.
