

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8a-zcw2-sa0s
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-5758

Comment on FR Doc # 2025-02305

Submitter Information

Name: Emily Olson

Email: [REDACTED]

General Comment

I do not believe AI holds a place in the future of the United States. In certain fields (medical being the primary field that comes to mind) it can be a useful tool, but as far as generative AI goes- AI used to assist in the writing process, coding, voice work, and creating art- it needs tight restrictions. These machines learn by stealing the hard work of real, living creatives; oftentimes without their knowledge or consent. As a creative myself, I've seen people use this technology to steal the livelihoods of my fellow creatives by offering fast, cheap commissions, stealing precious few seats from conventions where many artists make their living selling their work, and being hired in big-name companies trying to save a few bucks by taking the cheap route with AI. Those who have worked with said companies have reported that these decisions only backfire in the end, as real artists still need to be on board to correct the mistakes made by the machines. Though these programs are brought on to save time and money, they only end up wasting time and money in the end, as individuals who rely on the machines to create art typically do not have an artistic eye themselves and do not know how to correct mistakes. Not to mention, it can take hours and countless samples of footage and tweaking prompts to make anything usable (a famous example being the hundreds of hours worth of content it took for Coke-Cola to make that 60-second AI generated Christmas ad).

As companies latch on to AI to force into their services, there is an outcry from the average American to make it stop. Google is already making jobs in confidential fields pointlessly difficult by causing security problems in documents and e-mails with no opt-out option. Artists have been begging for more security for ages with their own copyrights in jeopardy thanks to the blatant theft. Websites such as ChatGPT are causing the fall of critical thinking in real-time as students would rather let a robot write their essays and do their homework for them than take the time to put in the work on their own; simultaneously destroying their own critical thinking and forcing teachers to work even harder than they already are by trying to detect if students are genuinely doing their own work or not. Not to mention Google's AI overview has proven time and time again to be riddled with (sometimes dangerous) misinformation.

Furthermore, the technology used to produce these images and writing and code consume large quantities of energy just to function. The planet is in bad enough shape without these power-wasting plagiarism machines- we don't need to make things worse.

In conclusion; generative AI has been a blight on technological advancements for the past couple of years. It wastes energy, steals work from living people, and is causing a decline in learning and critical thinking. Now more than ever, we need to protect the works of living and breathing people. We don't need machines to steal our joy and creativity.
