General Comment

I do not believe the route AI is going will hold a place in the US. Generative AI is an overhyped algorithm that guesses what words should follow each other. I fail to see why companies that specialize in this, like OpenAI, should be given such free reign to take any data they want.

Allowing OpenAI to bypass copyright will only harm countless Americans employed in many creative fields. Not being compensated for their work being used as training data is harmful to the livelihoods of many, especially those who cannot afford the lengthy legal battle of fighting for their copyrights. If the trend continues, we could easily see many employed creatives and hopeful, artistic children lose out on job opportunities to a soulless computer because it costs less.

This is decidedly NOT a brighter future for these Americans.

If these companies have such problems with gathering training data, why not hiring consenting creatives to make various works for them? Or field responses from the consenting members of the public? I'm sure there are several would enjoy contributing to AI datasets. Why steal from those who do not want AI mimicking their styles?

OpenAI already has partnerships for generating data, such as with Reddit. There is no reason to give freedom to steal works from Americans. Proponents to this proposal may argue that Chinese rivals don't have these limitations. I would hope those in charge recognize the value of privacy, ownership, and freedoms that us Americans have that Chinese people don't necessarily have.
