General Comment

Large language models (LLMs) as a technology have reached the peak of their usefulness. LLMs are very good at predicting sequences of words, but that is c the extent of their capability. LLMs are not capable of reason, nor are they going to lead to better technologies.

The money being thrown at this technology is going to see fewer and fewer returns on investment. Further, there is no model that currently generates a profit. These models cost more money to operate than they generate in revenue. Companies developing LLMs depend on frequent cash injections from investors with no reasonable plan to recover those losses except the false promise that the technology will become so ubiquitous that profits will be realized at some unspecified time in the future.

It would be foolish to dismantle or undermine intellectual property laws to prop up this dead-end technology.
