General Comment

Artificial Intelligence is being touted around as a revolutionary tool and cost cutting, time saving solution when in reality its an invasive, messy, uncaring algorithm that steals data, images, and video with no regard for where it came from or how it was made. It seems like the future and the way forward, but it isn't what we're being made to think it is by companies. Its very expensive to maintain, spreads misinformation, a security risk for sensitive data, and will be used to replace human labor for no good reason. Its already caused more harm than good by making everyone second guess information and images they see if it seems even a little out of place, and will only get worse if its allowed to invade more spaces to train on more data. While it may be unreasonable to think it can be removed completely, it must at the very least be regulated, restrained, and can't be allowed to have unchecked power. We could very well get to a point where nobody knows what the truth is anymore since it'll all be written by machines.
