General Comment

LLMs are a fad. They are not useful to consumers, and any attempts to shoehorn them into workflows results in more errors and less accountability for those errors.

However, in an attempt to further develop these models (thus allowing for the creation of hype-building press releases), many AI companies have demanded the ability to scrape data from the entire Internet, with complete disregard for any form of licensing or copyright law. AI training bots already blatantly ignore robots.txt (a manner to tag content as being inaccessible to bots), and giving them an exemption from copyright will destroy the American intellectual property system.

Additionally, it is physically impossible to scale LLM models in a way that will make them profitable -- they require too much data, too much power, and too much hardware. OpenAI is bleeding money. Anthropic is bleeding money. These companies are going to collapse under their own weight, and if the government puts too much money and political power into keeping them afloat, it will be dragged down with them.

In 20 years, do we want to be known as the nation that let an unsustainable business model collapse in on itself? Or do we want to be known as the country that destroyed its copyright system chasing a technology fad?
