General Comment

I strongly oppose excepting AI from copyright regulations and allowing to take creative works without compensation. Large language models can't answer questions, only predict what an answer looks like, and are unsuitable to be regarded as sources of knowledge even if OpenAI, Google, Microsoft, or any other company may be pushing to put AI assistants into everything consumers may use. Disregarding human creative work for AI would be enormously detrimental to the country, as it would directly incentivize companies to take the work of others to produce inferior substitutes for human work. Large language models can't create, they can only mash together what they've seen before according to probabilities they've learned from giant bodies of works taken without compensation from the people who worked to create them.

If a company cannot be profitable without being able to take anything any human has ever written, drawn, or imagined without compensation, it ought not exist, and we should not revise copyright law for such a purpose.

I do not believe that AI will become the profitable dream that has been promised through the LLMs currently deployed, and to my knowledge, the existing models aren't anywhere close to become profitable, nor do they have use cases that merit the enormous investment, nor excusing allowing the taking of intellectual work by removing the protection of intellectual work. It's a bubble that will pop, and similar to how Tesla has repeatedly promised full self-driving soon, the promises of wonders and benefits are promised and embroidered, and there is no moral or compelling economic reason to remove protection of law for the benefit of AI training.
