## General Comment

AI is an area of technology that has rapidly developed within the last few years, and alongside that rapid development has followed an even more aggressive growth of financial interest in the area. This financial interest has led to an eschewing of caution as the mechanisms of finance continue to invest more and more into a technology that has failed to produce widespread demand from consumers.

Furthermore, AI has the potential to be highly destructive to a variety of industries, and the environment. Generative AI focused on creating text, images, and videos put at risk the careers of lifelong artists and creators. America, as the global leader in film, Television, and music should be doing everything it can to uplift and protect creators, not outsourcing their jobs to machines.

Furthermore, the energy demands of AI can only be characterized as wantonly wasteful, especially in a period of time where we stand at the brink of a climate disaster.

AI is a technology with great potential, and for decades machine learning has been delivering technological advancements that greatly improve the life of everyday people. I am certain that AI will continue to lead to significant technological developments in the future as well.

However, the current push for widespread, unregulated adoption of generative AI risks sapping vitality from the creative workforce of America, and draining America's environmental resources, with no clear benefit beside enriching those who control the technology.

AI must be strongly regulated. Regulation is what forces companies to act in the interest of the American people. While regulation may increase the difficulty of developing value for corporations, that is not the concern of the US government nor the concern of the American people.
