Status: [REDACTED]
Tracking No. m8b-0dr4-126k
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-6559

Comment on FR Doc # 2025-02305

Submitter Information

Name: Chris Arnold

General Comment

I'm a computer scientist with experience in artificial intelligence and let me impress the importance of this: OpenAI does not need a free pass to illegally exploit copyrighted material and they absolutely do not need any taxpayer money. A market for LLM AIs has not emerged despite the several years of hype and the models are poisoned with their own outputs. They pose a significant risk to the quality of available information which is already apparent to anyone who has attempted online research, replace human jobs with incompetent sycophants that regularly fabricate falsehoods, and are a critical climate risk in their waste of resources.

America's AI efforts should be directed to medical technology and large dataset analysis tools, which is what AI is best suited for. LLMs can not and will not fulfill the pipe dream of a generalized artificial intelligence, the definition thereof being difficult to pin down and subject to goalpost moving to impress corporate boards. Despite the huge effort in developing them, LLMs have thus far not emerged as anything more than expensive toys, one that we cannot afford to support when they fundamentally do not work.

OpenAI in particular has been a significant eyesore in AI development and more money and more access to copyrighted material will not improve their performance when more trim, more efficient startups with worse hardware have been outperforming them. Due to the erosion of their board several times, financial difficulties, and poor public person, their business partnerships with leading technology companies like Microsoft has been dissolving. The only sensible strategy is to turn to the old American tradition of encouraging competition. If Chinese data scientists can do better for cheaper, or at least rival certain aspects of the performance with comparatively infinitesimal resources, why can't we?
