## General Comment

If AI is allowed to circumvent copyright, it will lead to the mass and instantaneous counterfeiting of every piece of copyright media on earth. Source code, all forms of media, and every written word will be subject to the most comprehensive form of plagiarism on the planet, all because some salesmen want us fooled into thinking their chat-bot will be able to save the world "at some point in the future." This is because it has been proven many times that any data or media that AI is trained on can be accurately recalled with the appropriate prompt (<https://arxiv.org/abs/2301.13188>.) Based on knowledge of my field, anyone with the basic skills required to de-compile source code could easily replicate important copyrighted software for resale (through the use of Generative AI,) denying royalties to the original creator, and fatally diluting the market for enterprise-level software development.

In the mean-time, all incentive for programming, art, writing, etc. will vanish in the U.S., leading to one of the largest brain-drains in U.S. history. Every computer scientist, artist, filmmaker, etc. would be out of their mind to try to sell or publish their works in a country where they have no protections to guarantee they are paid for it. We would truly become just like China: a place where only wealthy- and state-sponsored media is protected from theft.
