General Comment

I am strongly opposed to this AI action plan. It is in effect giving power to tech companies, and AI companies in particular, to train their models and technology for free, on the works of millions of hardworking creatives and on even the online activity of ordinary people. They do this with zero compensation to the people whose works they are using, and profit massively off it. Allowing AI companies to run roughshod over the work of actual human creatives is desecration of our entire cultural works, as a species let alone the cultural legacy of our nation.

What's more, AI despite becoming the big buzzword of the last few years is in fact mostly driven by developments in Large Language Models (LLMs) which are not intelligent, nor sentient. This fact, and the nature of how they only can produce outputs based on training data, and often do so with low accuracy (often referred to as the AI "hallucinating"), makes them prone to inaccuracy and bias, and acting as if we can replace millions of jobs, in the government OR private sector with this seamlessly is quite frankly a threat to our economic stability and national security.

AI and machine learning systems will indeed play large roles in science and technology in the future I expect. But what is being pursued by tech companies and pushed as necessary such as replacing thousands of people with AI and inserting LLM based technologies where they are not suited is a dead end. Putting all our eggs as a country in the AI bubble basket just because it is shiny and new would be nothing more than a handout to tech companies at the expense of average Americans, and damage our economy and standing in the world all because of misguided fear that others will "beat" us in an "AI race" that no one asked for in the first place. Useful applications of machine learning will show themselves without us needing to play into technology hype that is damaging to actual humans and their careers and futures.
