General Comment

There are two kinds of artificial intelligence, and one of them is useful, while the other is not.

AI is at its best when it parses and sorts through data quickly, and this is the kind of use that should be emphasized. However, even this usage should be double-checked by humans.

Generative AI is much less useful, particularly when it "hallucinates" (or lies). AI is not a search engine, and it shouldn't be used to synthesize answers.

Training the model for this usage also raises a number of concerns, including copyright and proper compensation for those whose work is used for training. It's also effective as a tool, but it shouldn't be used to take jobs away from people.

Analytical AI with safeguards is the most reasonable use, but any action plan should consider the negative impacts on creative work and other areas.
