General Comment

I strongly encourage the NSF to not relinquish their responsibilities to regulate the Artificial Intelligence industry. Although the industry styles itself as developing artificial intelligence, I say as someone who has studied artificial intelligence in cognitive science and cognitive psychology coursework that these large language models are little more than prediction machines. The programs add little to no insights on what data is entered into them, and on the contrary often result in hallucinations and generalizations that make no sense to subject matter experts. It may seem that these programs are close to making a breakthrough where they will be reliable, and indeed many industry leaders make outrageously rosy claims about what their programs will be able to do, but there is no actual reason to believe that such a breakthrough is close. Allowing these companies to use data/material without paying for it is theft. Allowing the companies freedom to do this will only throw mountains of valuable money and resources (water and land) into a pit. There is no reason to have faith that any of these investments will pay off. Over-reliance on current LLMs is much more likely to lead to error and a stifling of ingenuity and creativity.
