As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8b-1cvq-vp08
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-7350

Comment on FR Doc # 2025-02305

Submitter Information

Name: Mary Oliva

Email: [REDACTED]

General Comment

Artificial Intelligence is a term with a nebulous definition not expanded on here or in the executive order, making it potentially extremely overreaching into the statutory rights that govern Americans and American businesses.

The “AI” industry, especially in its generative capacity, is itself artificially held up by its theft from copyright holders across the US and the world. Executives in AI companies have admitted that the models are nothing without the illegal incorporation of others’ intellectual property via “scraping.” Not investigating the actions of these companies against those rights-holders would be a clear unequal application of the law.

This could ruin the livelihoods of countless innovators and artists through the theft of their work.

Then there is “AI” search engines scraping the whole of the internet, legitimate sources and fiction, and often providing false, misleading, or “hallucinated” answers. It has been shown to cite scientific papers that don’t exist and make up legal precedence.

With that level of problems, it should not be relied on for information — and that is without digging into how its confusing amalgam of information again takes away from actual people by preventing visits to websites that have the information searchers are actively looking for.

Artificial Intelligence, especially its generative form, have also been shown to use excessive amounts of energy. Adding processing locations in the US may strain the grids of nearby communities at the best of times, and cause their power costs to increase as people compete with computers serving people in far flung locations.

Large language models and machine learning have places in closed systems, but the push for AI across the board is inherently exploitative and will harm people across the US, while benefitting a handful of companies by allowing them to commit widespread theft of other peoples’ creations.
