## General Comment

The so-called "Artificial Intelligence" in question for this "Action Plan" consists of Generative pre-trained transformers and diffusion-based models. These pointless and stupid technologies were rushed to market by packs of unimaginative tech company managers who were out of ideas and came up with the bright idea: what if we just steal the entire intellectual property of the world, and regurgitate it to customers in a worse form through an annoying chatbot interface? Since that was apparently not enough, why not do it with the most wasteful, energy-intensive technology possible? Since this idiotic escapade began, the companies have been hemorrhaging money at an alarming rate despite the theft of intellectual property. There has never been a worse and more short-sighted business model in the history of humanity.

As an author and musician whose intellectual property not only has provided part of a living but has driven economic growth in the US, I join millions of other artists, musicians, programmers, videographers, engineers, and scientists in firmly opposing all attempts by companies including but not limited to Open AI, Meta, Google, Stability, Anthropic, Suno, and Udio, to circumvent copyright restrictions in the name of GPTs, LLMs, TTIMs, and related technologies. Copyright drives economic growth: these pointless, wasteful technologies can and will only inhibit it.
