General Comment

To Whom It May Concern,

What Large Language Model development companies refer to as "Artificial Intelligence" is nothing of the sort. It needs to be understood that these systems are black-boxed pattern-matching algorithms aimed at identifying the patterns which appear commonly in training data and reproducing those patterns or approximations thereof.

These systems are limited by the extent of their training data. There exists no "AI" system which can produce functional results in the absence of human-generated material; when access to human-generated material is revoked, the abilities of the "AI" diminish rapidly with attempts to train recursively. Each and every result of "AI" systems is derived from some aspect of the training material, and to render human labor mere grist for the mill fundamentally disconnects us from our creative products. In so doing, generating from the sum total of human knowledge an eternal remix album that never truly steps outside of that which came before while displacing artists who may otherwise have been able to reach such a lofty height.

"AI" is fundamentally incapable of comprehension, of contextualization, and of discernment - it only matters what output creates a response to the prompt that most closely resembles those patterns observed in its training data. This can even allow a clever actor to extract fragments of that training data with careful prompting, as the machine will read the prompt and match a response without awareness of what it is doing or why it is doing it. Additionally, this lack of context or comprehension allows for the production of statements, claims, or conclusions which range from the nonsensical to the outright dangerous. These tools cannot be ethically applied without heavy oversight at the bare minimum. Not even the regulations presently in place are sufficient, though they are necessary.

Setting aside the fact that "AI" does not perform such tasks or bear the qualities of intelligence as claimed by its proponents, the economic purpose of "AI" is simple and disastrous to the American people. As used today, "AI" functions to grant wealth access to some approximation of otherwise irreplicable skill, while denying skilled personnel access to wealth. Large corporations are eager and ready to replace large swathes of the workforce with "AI" systems, and are willing to accept the dramatic loss of actual function this will incur, if only it would rid them of having to pay for actual employees. The impact this will have on America's economy barely needs saying, but for the sake of this comment: this country will never fully recover from allowing these excesses to fester.

I implore those who read this document to decline any and all requests by companies building Large Language Model "AI" products to access our data. If they desire to use all of the data which they can possibly access to improve their product, they are fully capable of purchasing rights from the copyright holders as required of any ethical creative enterprise - and they are more than wealthy enough to do so.

This document may be publicly disseminated. The document contains no business-proprietary or confidential information. Document contents may be used by the government in developing the AI Action Plan and associated documents without attribution.

Consent is not given for the use of this document to train "AI" models or systems which approximate their functionality.

Thank you for your time.
