General Comment

AI data centers consume large amounts of electricity. They are usually put in areas with lower energy prices, but then drive up rates for everyone due to the large demand.

The amount of energy needed will stress our electric grid and if electricity is scarce, this business will get priority over citizens.

The increased need for energy will give energy companies the leverage to increase burning fossil fuels, causing air quality to plummet and increase carbon emissions.

I fear that the short sightedness of this endeavor will not address needed infrastructure updates, which will end up hurting the communities these centers are forced into.
