Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8b-1pb3-m466
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-7660

Comment on FR Doc # 2025-02305

Submitter Information

Name: Julian Rolon

General Comment

I am highly against the usage of Artificial Intelligence (AI) within the context of what is being purposed here. Within this presidential order, what this action plan will do is generally steal from all sources of data without any individual or organizational consent to participate within this plan to begin with. Any individual or organization does not have the ability to opt out of this "voluntary process" that this plan suggest and will allow anyone who is gathering data from all "volunteered sources" to do so without any legal ramifications.

Simply put, it is stealing data from all individuals in the hopes of gathering, training, and using our own data against the American people. It will massively accelerate the usage of misinformation due to faulty AI generated or user spoofed results, cost the American people more money to sustain this failing effort, and cause more damage to the environment due to its constant need of powerful computer equipment that needs a massive cost of high energy consumption to even run such a powerful algorithmic AI models.

- * I do not believe AI holds a place in the future of the US.
- * AI steals from the livelihood of many Americans and promotes profits off of theft.
- * AI is considered to be over-hyped due to its marketed "promise" and is fleecing/lying to the eyes of the American public.

In addition to my personal beliefs in this matter, I am also including the following information below which I HIGHLY recommend you read through in its entirety. It will highly some of the key issues that AI will bring to the American people and will further plunge us into paying for a project that is doomed to fail.

While OpenAI has made significant strides in advancing artificial intelligence, there are several disadvantages and challenges associated with its technologies and operations. Understanding these limitations is crucial for users, developers, and stakeholders involved with OpenAI.

Accessing and utilizing OpenAI's advanced models, such as GPT-4, can be expensive. The pricing structure for API usage may be prohibitive for individual developers, startups, or small businesses with limited budgets. This high cost can limit the accessibility of OpenAI's technologies to a broader audience.

OpenAI's powerful AI models have raised ethical issues related to their potential misuse. These concerns include:

- * Content Generation: The ability to generate realistic text can be exploited for creating misleading information, deepfakes, or spam.
- * Bias and Fairness: AI models can inadvertently perpetuate and amplify existing societal biases present in the training data, leading to unfair or discriminatory outcomes.
- * Privacy: The use of large datasets for training models may raise privacy concerns, especially if sensitive information is involved.

Addressing these ethical challenges requires ongoing efforts in research, regulation, and the development of robust safeguards.

While OpenAI publishes research papers and shares insights into their models, some aspects remain proprietary. This limited transparency can hinder the broader understanding and trust in how these models function. Users and researchers may find it challenging to fully grasp

the inner workings or limitations of OpenAI's technologies without complete access to the underlying mechanisms.

Training state-of-the-art AI models like those developed by OpenAI demands vast amounts of data and significant computational power. This dependence on extensive resources can lead to:

- * Environmental Impact: The energy consumption required for training large models contributes to a substantial carbon footprint.
- * Resource Allocation: Organizations with limited access to high-performance computing may struggle to compete or innovate at the same pace.

The centralized control of powerful AI technologies by organizations like OpenAI raises questions about governance and accountability. Ensuring that AI development aligns with societal values and benefits all stakeholders is a complex challenge that requires collaborative efforts between developers, policymakers, and the public.

Despite efforts to make AI more accessible, there remains a gap in democratizing these technologies. Factors such as high costs, technical complexity, and limited educational resources can prevent a wider audience from leveraging OpenAI's tools effectively. This disparity can exacerbate existing inequalities in technology access and innovation.

The use of AI-generated content introduces complexities around intellectual property rights. Determining ownership and rights over AI-generated works, such as text, images, or code, is an evolving legal area that can pose challenges for creators and businesses alike.
