

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8b-1yii-9a68
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-7880

Comment on FR Doc # 2025-02305

Submitter Information

Name: Aaron Gaskill

General Comment

Here is my argument against the investment in AI:

Ethical Concerns and Misinformation:

Generative AI has the potential to create misleading or entirely false information that can spread quickly. AI-generated content, including images, videos, and text, can be indistinguishable from real material, making it easier for malicious actors to deceive the public, influence elections, or spread propaganda.

Deepfakes, for example, can be used to create fake videos of public figures, leading to serious consequences like defamation, manipulation, or even threats to national security.

Job Displacement and Economic Inequality:

As generative AI becomes more advanced, there is a growing risk of massive job displacement. Fields like journalism, content creation, design, programming, and even some areas of healthcare may see significant job loss as AI takes over tasks traditionally done by humans. This could exacerbate economic inequality, as the benefits of AI will likely be concentrated in the hands of a few large corporations and tech companies. The displacement of workers without adequate social safety nets or retraining programs could lead to social unrest and widen the wealth gap.

Loss of Human Creativity and Skills:

As generative AI tools become more accessible, there is a concern that humans may rely too heavily on them, leading to the erosion of traditional creative processes and critical thinking skills. Artists, writers, and other creators might use AI to automate parts of their work, reducing the value of original human creativity.

Over time, this could result in a world where content becomes formulaic and uninspired, as AI lacks the true emotional depth and personal experience that humans bring to their work.

Bias and Lack of Accountability:

Generative AI systems are trained on data sets that are often biased, reflecting the prejudices and stereotypes present in society. These biases can be inadvertently reinforced by the AI, leading to harmful and discriminatory outputs.

Additionally, AI models lack accountability. If AI generates harmful content or makes errors that lead to negative consequences, it is unclear who should be held responsible — the developer, the company, or the AI itself? This lack of clarity in accountability raises serious legal and ethical concerns.

Environmental Impact:

Training large generative AI models requires significant computational power, which consumes vast amounts of energy. Data centers and the hardware required to run these models contribute to a growing environmental footprint. As AI models become more sophisticated, their energy demands are likely to increase, which could have a detrimental effect on global efforts to reduce carbon emissions.

Dependence on Technology:

Generative AI, if integrated too deeply into daily life, could create a dangerous over-reliance on technology. If AI systems are used to create content for social media, news, or even personal relationships, people might become disconnected from genuine human interaction or even fail to develop their own thinking skills, trusting AI too much for problem-solving and decision-making. This growing dependence on machines might undermine individual autonomy and critical thinking, leaving society vulnerable in the event of technical failures or cybersecurity breaches.

Security Risks and Misuse:

As generative AI becomes more powerful, it could be used for malicious purposes, such as creating more advanced cyberattacks or weaponizing AI to manipulate financial markets or infrastructure.

Cybercriminals could use AI to automate phishing attacks, craft convincing fake communications, or even simulate legitimate voices to steal personal information, thereby increasing the scale and efficiency of cybercrimes.
