General Comment

I am an American citizen who cares deeply about art and human expression. I create digital art as a hobby and know many who's primary income is to create art (of all different sorts). I stand opposed to generative AI as a whole and the companies behind it, both American and foreign.

I believe that AI development has gone far enough and allowing them to ignore copyright is a massive and misguided overstep of power. I do not believe this is a matter of national security and I think this is a fabrication on behalf of companies such as OpenAI to create national fear in order to push their own ulterior motives.

I believe the best thing we can do is put even more restrictions on generative AI products, not remove restrictions but allowing illegal circumvention intellectual property. There is no doubt that artificial inelegance can be an invaluable tool such as in research, but the current state of AI is overbearing and destructive of the carriers of millions of American citizens.

On top of being detrimental to artists, it is destructive to the health of citizens as a whole. Generative AI is touted as something that could thing and act for you and I think giving them total control would be a terrible thing for the intelligence of our country (and frankly the world) as a whole. Less and less people are creating things on their own, not learning why things work the way they do in tasks such as writing, programming, research, painting, et cetera. I believe that if we continue to let this already growing problem fester, no one will know how to do anything. Humans will always push the industries forward, and those who opt to use AI are doing a disservice to themselves to discover things for themselves. Consider that maybe who could have been the greatest scientists of our future were held back by the temptation of AI.

In conclusion, I believe we should be restricting generative AI further rather than promoting and giving it unlimited access. I believe that is not only harmful to the jobs of American artisans and researchers alike, but to the populous as a whole by making them less willing to make decisions and learn on their own. I believe that AI companies are disingenuous of the impact this would have and that they are claiming it's a case of "national security" to spread fear.
