Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-7991

Comment on FR Doc # 2025-02305

Submitter Information

Name: Louis Lee

General Comment

I and the majority of people I know have virtually no faith in the current administration. We'd love to be proven wrong by seeing competency and effective results from the agencies that claim to serve us or, at the very least, serve businesses and consumers.

The further proliferation of generative AI would compromise corporations; their own copyrighted assets would become increasingly vulnerable to exploitation. Additionally, "AI" as a marketing term is being met with less and less trust. Dogan Gursoy, the author of a study into AI products (see: <https://www.tandfonline.com/doi/full/10.1080/19368623.2024.2368040>) said "In every single case, whenever we mentioned 'AI' vs 'high tech', consumers' purchase intention went down." Anecdotally, I and the majority of people I know find the aggressive push of AI on tech platforms obnoxious and intrusive.

I strongly oppose the development of this AI action plan. Generative AI is proven to be full of erroneous data. It gives you information that makes you sound stupid at best and bring bodily harm to you at worst. It will cripple your kid's ability to think critically and communicate eloquently.

The white house website states "With the right governmental policies, continued U.S. AI leadership will promote human flourishing, economic competitiveness, and national security." However, the current administration could not possibly be more poorly equipped to handle such aspirations without negative consequence. No one among American leadership has demonstrated a productive or even rudimentary understanding of the technology in question. As previously stated, consumers often avoid AI based products, there is no economic competitiveness to be gained. The idea of basing nat sec on AI is dangerously ludicrous.

AI-generated search results have suggested making pizza with glue, eating rocks for nutritional health confusing satire for genuine advice, and mixing chlorine bleach with white vinegar in laundry which creates toxic gases. What dominance could we possibly derive in nat sec from systems that can't tell the difference between legitimate medical advice and jokes posted by Reddit users? I am not convinced that AI will become "smart" enough to prevent this misinformation. Human error is clearly more preferable over clumsy software when it comes to parsing communicable knowledge.

This administration is wholly incapable of drafting AI policies with an intelligent and impartial eye. Trump's lies and ineptitude are well-documented, as are the lies and ineptitude of his owner, Elon Musk. If they are the pillars who decide how our data gets used, then God help us all.
