## General Comment

Enacting this Plan would be a mistake for the United States of America. The current "burdensome" legislative barriers to AI development perform a vital service in ensuring the reliability of American information and in maintaining the quintessential soul and intent of cultural creation.

Social media is already rife with AI generated clickbait content and fake news. A future with unrestricted AI development and deployment would see little authenticity in all facets of life; more than a cultural issue, AI has been known to push incorrect and dangerous information when responding to innocuous prompts. This false information can kill.

With the rise of AI writing tools like ChatGPT, students have every opportunity to cheat the education system. No American will benefit from inflated academic figures. Even if ChatGPT works with educators to safeguard academia, removing restrictions on AI development and deployment will enable competitors to roll out alternative tools which can bypass existing and future academic authenticity checks.

Given current global and economic tensions, it is unwise to lift the set restrictions. These groups dominate a large share of the tech sphere; any interference during unprecedented expansion would be catastrophic. A cyber attack, perhaps, could target a small company to test existing defense measures and plan for a larger-scale offensive. An economic impediment, such as a halt on hardware import or manufacture, would have these companies collapse, leaving consumers without the tools they have potentially built their businesses around. An energy crisis would invite corruption as these AI giants clamored to take what little power there was to go around in order to fuel their incredibly demanding servers and computers.

Many careers are also at risk of being replaced by rampant AI. Artists, musicians, and writers are the backbone of our nation's cultural identity. Given a few years, a single tech-savvy programmer could replace an entire team of career artists to produce a gallery-worthy collection for the highest bidder. Corporations would jump at the chance to cut labor costs by firing writers and other creators in favor of much cheaper AI. Technological advancements have replaced careers in the past, but these replaced jobs were dangerous and taxing: millworkers, assembly line workers, and farmers used to toil for hours in unsafe conditions, but now are working harmoniously with technology that keeps them safe and well. To replace these cultural creators would be to suck the life out of art and media.

There are too many variables and too many dangers. Artificial Intelligence must be watched closely. This Plan must not be enacted. Let America be the premiere in \*safe\* AI development and deployment. Let AI be a tool guided by the government, created by the people and for the people, not for profit.
