General Comment

I do not believe Large Language Model and Diffusion Model AI has a future as a transformative technology in the United States or indeed, the world. This technology by its very nature cannot ever be reliable or be capable of novel insight or information--all it can do is make probable guesses based on the data it has. Moreover, given the reckless speed with which this technology was released and hyped, there is a large amount of ai-generated data on the internet, which is then routinely scraped and put back into these models. This causes model collapse. This technology is doomed to devour itself and get worse over time, even if the U.S. makes the idiotic mistake of giving Open AI et al carte blanche on Copyright Violations. Does having access to every frame of the Garfield Movie going to prevent cyber attacks from China? Will the contents of every self-published novel on Smashwords predict the next terrorist attack? No, it absolutely will not. I'm sure machine learning has its place in specific applications with carefully curated data sets but attempting to create some sort of computer god by shoving all publicly visible content into data centers that strain the power grid in order to produce functionally useless results like inventing court cases wholecloth or telling end users to put glue on pizza simply isn't rational or necessary. This technology is tremendously expensive in a literal dollar sense and via externalities like power and water. It has not yet given a return on investment, and it's sheer folly for this country to swoop in and prop up this sick horse as it falls to its knees. It's simply not worth throwing the nation's culture in the form of films, art, music, and writing under the bus to do this. Let AI lie in its own grave.
