General Comment

AI as a technology is another Dot Com bubble waiting to burst, and I think focusing on AI as something that will uplift American tech is short sighted and mistake. In the current race of companies trying to implement and expand their use of AI, its become clear that AI is full of faults and risks that have yet to be properly addressed by the government.

Outside of the ethical concern, such as the fact that AI has and will be used to replace the jobs of hard working Americans in an attempt to make more profit, there are security risks and flaws that rapid expansion of this technology between various sectors, both public and private, will only make worse. AI is known to have frequent "hallucination," which are instances of AI creating false information and presenting it as fact. Already there have be instances of AI creating false legal cases which were referenced by lawyers in court, putting those cases in jeopardy. There have been instances of AI customer service implemented by companies that have given customers false info about company policy, opening the door for legal action against companies and confusion, dissatisfaction, and weakening trust from consumers when it comes to engaging with companies that heavily us AI. There are also plenty of security risks that AI can pose both for the average user and for a company. I know people personally who have spoken about AI assistants meant to transcribe certain meeting notes, joining meetings on their own and sending transcripts with sensitive information about company workings and workers to people who were not only not part of that meeting, but were not approved to have access to these transcripts in the fist place.

What does it mean if consumer, corporate, and governmentsites start implementing AI rapidly? All I can see is a weakening not only of US internet security but also increasing distrust from Americans. How can a customer trust a site that will give them false information on refunds? How can a company? What legal turmoil will American companies face when AI lies to both them and their consumers? What about government agencies?

As I said at the beginning, AI is a bubble waiting to burst. While there is novelty to it, I and many others I have spoken to have quickly gone from interest and curiosity in this new form of technology, to wariness and distrust, avoid use when possible. Heavy investment in AI by the US, in my opinion, would be wasteful at best, and actively harmful at worst. I ask that you please consider these concerns and how it will adversely effect consumers, US companies, and government agencies should this technology be blindly pushed without proper consideration.
