General Comment

The simple fact of the matter is that AI is a dead end industry, with about as much life left in it as the NFTs that came before it. Despite the resources poured into it--billions of dollars, vast quantities of stolen IP and natural human conversation--the technology hasn't meaningfully improved since its public debut and remains so consistently bad at the tasks it's put to that, if it were human, it would've been fired and blacklisted from multiple industries ages ago. Its sole purported value is in reducing or removing human labor at multiple points, yet between its frequent errors and its constant demand for new human-generated media to train on it actually increases the time and cost of production for a lower quality result.

This isn't even getting into the matter of gutting the American creative industries that have kept our culture globally dominant for so many decades, but other commenters will have that angle more than covered.

If you want America to remain relevant in the coming century, you cannot embrace AI. Get ahead of the curve. Reject it now.
