General Comment

AI may be an important tool for some applications, but it must be used responsibly and only once it has been refined and verified that it will not do harm.

There have been numerous instances of "AI" and Large Language Models being loaded with amounts and types of data they weren't ready for or meant to process, leading to unforeseen and inappropriate circumstances. Examples include chatbots showing approval for Nazi ideology and tactics, aggressive bully-like tendencies, and providing outright false information about topics through "AI summary".

We can't remove guardrails and allow "AI" companies to consume personal and copyrighted material for their work. These content pools should consist of either openly available information (such as public records, open source material, and public domain works) or content authors have opted into use for these purposes.

In addition, AI models should not be allowed to be used in critical industries without proof that they are properly functional and will not endanger human lives, and that there are human safeguards in place in the event that something goes wrong. Incidents like Tesla autopilot failures and other failures related to automated processes are proof that machines and AI can not be left unattended and unchecked.
