General Comment

As I understand it, the question is whether companies that are developing LLMs, which we colloquially describe as AI, should be allowed to ignore copyright law. I do not fully understand the question--the law is the law, and it should be followed. If a business model is built on breaking the law, then companies should develop a new business model.

These companies should not be allowed to steal work that belongs to other people and other companies. It is theft, and in service of what? AI provides no social good. It is a large-scale scam. Companies have forced it onto products as part of their general trend of making their products worse. They are not responding to consumer need, they are trying to force AI on us, and then they are trying to commit large scale crimes to further develop AI. I cannot see a benefit coming from this.

Even if AI were not based on large-scale copyright violations, it would still not be ethical--it consumes obscene amounts of power, which could be better used for a million other things.

However, even if AI did not consume power and damage the world, even if it was not unethically sourced, even if did not depend on theft of intellectual property, I STILL would not want it; all it does is badly summarize things, with errors introduced, and all students to cheat on their writing assignments. It is dumbing us down as a species.

In conclusion, I do not feel that LLM companies should be given a license to steal. Thank you.
