General Comment

I do not believe AI holds a place in the future of the US. AI steals from my livelihood as an American and profits off of theft. AI is overhyped and is fleeting in the eyes of the American public. AI is actively harming small business owners in America, and it will only continue to do so if copyright protections aren't honored. Changing the rules and giving AI a copyright infringement exemption will hurt real Americans, including myself. If the argument in favor of granting an exemption is that honoring copyright makes it harder to develop the software, then that software doesn't deserve to exist. If it cannot exist without harming people's livelihoods, then it is not worth supporting. In a capitalist society, plenty of other companies have managed not only to survive but to thrive under the current legal standards. If we make an exception for AI software companies, they then constitute a strain on the market by existing when the weakness of their products should have removed them from the field. And again, if the argument is that following the law would make it too difficult to develop software, I would remind AI developers of the amazing people who wrote the code that brought us to the moon, well before any version of advanced computing existed. Those intelligent, resilient Americans did not cower in the face of difficulty. Further, if the AI models need more information in order to grow, what are they supposed to do after they've fed in all of the stolen material that should have been protected under copyright laws? Because they'll eventually run out of new information to feed the programs, and the programs themselves will cease to be valuable or worthwhile. And then you've stolen from the American public for nothing. This is not only shameful but dangerous, and it will do detrimental harm to the American economy.
