An Artificial Intelligence Action Plan should include clear, effective, and immediate protections for copyright holders and for public privacy. Protections against copyright infringement and for privacy are actionable and publicly agreeable foundational steps to ensuring that a successful future for AI can be realized. The rights of copyright holders should not be risked, because as time goes on even arguable infringement will become so prevalent as to be damaging to the interests of individuals and private entities alike. As well, if the unrestricted growth of AI is allowed to continue and users' privacy continues to be violated, the already prevalent public rejection of AI will only increase, damaging the current investments of those with interest in AI and damaging the overall usefulness and efficacy of AI itself, ruining its prospective value. Enacting clear, effective, and immediate copyright and privacy protections is an actionable and publicly agreeable first step to working with artificial intelligence, regardless of who's interests are at stake.

The rights of copyright holders should not be risked. Due to AI's widespread rapid growth, anyone interested in protecting their copyrights against infringement will face increasing difficulty as time goes on. Ensuring clear, effective, and immediate protections for copyright holders is an achievable first step that can be taken now to protect against a difficult future. If copyright holders' protections are not enforced as clearly, as effectively, and as immediately as possible, AI threatens to infringe on everyone's copyrights, including artists, businesses, corporations, political entities, and any other copyright holders. Even the people and entities currently wielding the greatest utilization of and having the largest investments in AI will soon want to seek their own protections against AI because of AI's rapid and unpredictable growth. If those protections are to be sought later, they are best enacted now. Enacting copyright protections now as clearly, effectively, and immediately as possible is essential for ensuring that everyone's interests will be effectively protected now and in the future.

Artificial Intelligence is being rejected on a large scale by users. Even Microsoft, a defendant in litigation related to AI, has recently disinvested in AI data centers, suggesting a devaluation in AI's prospects due to user rejection. As AI violates its users' privacy, it erodes its users' trust. As AI indiscriminately collects data, it erodes its own efficacy. Clear, effective, and immediate curtailing of AI's widespread and indiscriminate data collection will help ensure the public's acceptance of AI and the further realization of AI's genuine usefulness as a tool. As it stands, even if AI were to become a massively publicly accepted tool, its indiscriminate data collection will make it unreliable to the point that individuals, businesses, and other entities will no longer find it useful. By that point, the investment in AI may be so great that disinvestment will cause massive loss to profits and huge general waste of invested resources. Unless AI can be integrated into users' regular lives in a way where it is generally accepted and where users are satisfied with its results, the companies and individuals utilizing AI will see ever-increasing resistance to their services, until they are forced to disinvest to massive losses. Taking the actionable step of clearly, effectively, and immediately ensuring privacy protections will not only benefit individuals and businesses, but will

also ensure that AI will not burn itself out and lose all prospective value it has as a tool for private and commercial use.

We must protect against AI's growth through clear, effective, and immediate copyright and privacy protections. Individuals, businesses, politicians, and anyone else who holds copyright all benefit from protection against infringement, and those protections will only become more sought after and difficult to achieve as time goes on. The unrestricted widespread collection of data without regard to privacy protection will only lead to AI's continued mass rejection by the public. These things will lead to AI's inevitable dissolution, regardless of its untapped potential. If AI is to be a useful tool for anyone, it needs to be accepted as a tool that makes people happy and becomes a useful part of people's lives. Enacting clear, effective, and immediate protections for copyright and privacy is an achievable foundational step to ensuring that any prospective value that artificial intelligence has to anybody can actually be realized.

Regardless of your or my politics, this is an issue that we can agree on. This is a beast that is untamed, and is not only rapidly growing in size, but starting a family. Do we want to let the tigers breed, until one day we wake up with their jaws wrapped around our necks? Or should we start designing the enclosures and leashes that will allow us to domesticate them, so that we can utilize their strength and foster their healthy growth? The leashes are within our grasp. Clear, effective, and immediate protections for copyright holders and for public privacy are the tools we need. Now is the time to establish them.

Thank you for reading.
