General Comment

This is an absurd proposition that will destroy the livelihoods of tens of thousands of tax paying workers and destroy thousands of small and hundreds of medium and large businesses for little to no economic gains. "AI" companies are resource intensive unprofitable businesses that will waste astonishing quantities of electricity and water to perform labor that is currently done with very little use of such resources and the quality of the works "AI" image generators produce is of uniformly low quality and is widely associated with bootlegs and scam products. What is being proposed is the mass theft of the work of every past and current craftsman and artisan undermining America's status as the cultural center of the world.

The loss of quality the wide use of these products would entail would completely erase the cultural and economic advantages that the American entertainment industries currently enjoy as "AI" programs can be copied and put to use by any person anywhere on earth. Currently, a wide majority of working artists today either dwell and pay taxes within the United States or work with American companies and clients generating billions of dollars in economic activity annually. America has earned this advantage through long standing investments in technology, education and the promotion of entrepreneurship and hard work. Artists and craftsmen spend years and frequently invest tens or hundreds of thousands of dollars to develop specialized skills that have made them the envy of the world. However, many cannot compete with the deluge of investor subsidized "AI" slop which greedy and short sighted individuals have flooded the internet with in an effort replace our most skilled workers. "AI" companies have burned hundreds of billions of dollars to temporarily provide their services at an artificially low price in an attempt to drive artists out of business. However the low quality of the output of "AI" products still hampers their efforts. They seek to steal from the hard working and skilled craftsmen in a desperate attempt to make their own deeply flawed products economically viable so that they might drive their competitors out of business and then jack up the price of their product to pay back the hundreds of billions of dollars they have already spent with no guarantee that they might even be successful or that their products might not be copied or usurped by foreign competitors as China has already done with a far smaller investment of money with DeepSeek.

To enable a system that punishes American workers for the benefit of foreign competitors is unconscionable and would pose a direct threat to the American cultural hegemony the United States currently holds over the globe. To put it bluntly, the mass adoption of "AI" programs would lead to a flood of minimally viable products indistinguishable from low quality products made elsewhere erasing the current power of American art and culture and steering billions of dollars of revenue to similar products produced by competitors in China and other nations. At the same time, this proposition will destroy countless jobs, enable the mass theft of American intellectual products and lower the quality of the products America produces, diminishing America's competitiveness on the global marketplace.

And finally, there is no indication that "AI" quality will meaningfully improve or that the harmful hallucination problems can be fixed under the current model. If for no other reason than to motive AI companies to work smarter and invest their resources more wisely, do not give them free reign to steal the work of American artists. Deepseek was able to achieve what it did with the tiny budget allotted to them because they had to work smarter due to their limitations of resources. American AI companies are bloated poorly managed juggernauts that threw an astonishing amount of money into a model of software that was colossally inefficient and built billions of dollars worth of unnecessary hardware and data centers because, without limitations, they didn't need to innovate. Over feeding will kill a business just like it will kill a goldfish. Enabling the destruction of copyright cannot be undone. It will hurt people and cost us a ton of money. And you might do it and see literally no benefit because some company in some other country was motivated to build it better by the very limitations you are considering lifting.
