General Comment

1) The Animation Guild (IATSE Local 839) along with Concept Art Association (CAA), The Human Artistry Campaign, and The National Cartoonist Society Foundation commissioned CVL Economics, a leading authority in economic development and growth, to conduct a comprehensive survey on the profound impact of Gen AI on jobs within the entertainment industry.

The study, conducted between November 17 and December 22, 2023, surveyed 300 C-Suite leaders, senior executives, and mid-level managers across six key entertainment industries to better understand how this technology is being used now, how it will be used over the next three years, and assessing how these technologies will impact creative workers.

About 21.4% of Film, Television, and Animation jobs (or approximately 118,500 jobs) are likely to have a sufficient number of tasks affected to be either consolidated, replaced, or eliminated by GenAI in the U.S. by 2026. As the state with the largest industry employment and industry concentration (or location quotient), California will be impacted the most (affecting 39,500 jobs) both in total job disruption nationwide and with respect to its own economy. New York also has a relatively high employment concentration and will see 15,100 film, television, and animation jobs affected over the next three years.

2) Analysts explore the Business Value of Generative AI at Gartner Data & Analytics Summit, July 29-30 in Sydney. They predicted "At least 30% of generative AI (GenAI) projects will be abandoned after proof of concept by the end of 2025, due to poor data quality, inadequate risk controls, escalating costs or unclear business value, according to Gartner, Inc."

3) Goldman Sachs put out a 31-page-report (titled "Gen AI: Too Much Spend, Too Little Benefit?") The report covers AI's productivity benefits (which Goldman remarks are likely limited), AI's returns (which are likely to be significantly more limited than anticipated), and AI's power demands (which are likely so significant that utility companies will have to spend nearly 40% more in the next three years to keep up with the demand from hyperscalers like Google and Microsoft).
