General Comment

The planet-killing theft machines should not exist, nor should the companies building them continue to be funded. However, I am of the belief that, besides many similar comments having already been submitted to that same effect, that the ramifications of the blatant and repeated copyright infringements necessary to keep the Generative AI Industry afloat are viewed largely as inconsequential relative to the potential profits they can bring it by those with actual power here. We can all be honest here; the chief and central motivator for supporting Generative AI companies here is monetary, and I think it has become more and more obvious they are rotten trees. The companies who have invested in "developing" these models have spent too much for it to earn nothing, and it has earned nothing thus far besides general annoyance from the public, and its users seem chiefly concerned with just generating pornographic images and "meme" images in the realm of "What if Shrek was Freddie Mercury!?" and for writing, just finishing homework assignments if they are children, and writing resumes if they are adults. It's embarrassing.

The companies funding the development of these generative ai programs are begging for deregulation because they are desperate for a turnaround. They have not earned any such bailout, if they would even find salvation in it at all. What deregulation and a waive of copyright infringement would largely do is encourage even less oversight over what models are trained on, and even less consideration over what they are or should even be allowed to train on in the first place. You must truly think for a minute, just a single minute, what unregulated, unmonitored, vast data collection like that of the entire world wide web would allow the Generative AI programs to produce. Every terrible thing you can think of, it will be able to reproduce, and as it improves, it will only become harder and harder to distinguish from reality, from the President being depicted as sucking on Elon Musk's feet of today to years from now when your neighbor Greg who doesn't let his daughter go out after dark to spend time with her boyfriend, so she uses a Generative AI model to generate an image of him cheating on his wife and then send it to her mother under an anonymous number claiming to be said lover; she won't even need to change her manner of speaking, she can ask ChatGPT to handle that for her as well.

When these programs develop to the point where they can learn a face from a few photos, when they have references of everyone to have ever been photographed anywhere on the internet, when it is able to reference and depict horrible acts because it has even trained off of sites the government will have shutdown years ago, but which still exist through these models' data banks, through the "memory" its developers have cultivated, what can anyone do to combat it? No one can overcome a near infinite amount of lies and falsehoods, creatable with the push of a button. Push back and regulation has to start and continue now, and it has to start with telling them to kick rocks. Society cannot die, and it especially cannot die for something that is unlikely to even make anyone any money, so people can giggle for 10 seconds at Shrek in Freddie Mercury's yellow jacket, which is just a hodgepodge of elements from a screenshot of Shrek the Third where Shrek has a King's Robe on, and a redraw of Freddie Mercury on DeviantArt from 2012 based on a screenshot from one of his concerts, with Shrek having a third eye due to the program not actually understanding what Shrek looks like, just the vague idea of what the keyword "shrek" should represent in pixels. It cannot be allowed to happen. Please.
