General Comment

By “removing unnecessary burden” you are opening a can of worms that you can not close. Those “burdens” exist to protect the people who were the creators.

Maybe they SHOULD carry the burden; isn’t that the price for training these AI models?

In addition, AI safety is a real concern you should be thinking about. I know many people higher up don’t understand technology, but the bottom line is that we NEED limitations otherwise things will get out of hand quickly. To be perfectly candid, we don’t fully understand how AI currently works; we don’t understand its thought process or if it even fulfills the objective we are setting out for it. For more information, I highly suggest Robert Miles at <https://youtube.com/@robertmilesai?si=wTfBVFH2nJuaSWE>

Removing this feels similar to removing regulations for medicines; we have these regulations to protect people so that harm isn’t done. It’s the same here; but instead of protecting people, this plan moves forward with trying prioritize hazardous development.

This isn’t even mentioning how these AI’s are trained and the social, economic, and environmental costs associated with this.

People should be able to decide how their works are being used; if they don’t want it to be used for AI, then they should be allowed to say that it can’t be used for training. Just sharing it online doesn’t mean they opt in for AI training. If it were, it would be like if you gave your credit card information to buy something online; does that give that website the right to use your credit card however they want? Of course not! Being online shouldn’t be an automatic opt in for allowing to work to be used however the viewer sees fit.

Of course, there is also the social cost. There is already an issue with false information being faked by AI; issues like these should lead to more regulation, not less regulation. If you have ever heard of the dead internet theory, then you should already know that this is already an issue.

Of course, the environmental impacts are straightforward; they are just expensive in terms of energy and bandwidth.

Finally, I just wanted to mention the economic cost. The stated goal is to preserve America’s AI dominance, but will that really be the outcome? Let’s not kid ourselves; even if the companies got all the resources they wanted, will that truly help the US? The AI probably won’t be used to help grow the country, but rather to get profit for the company. Note that the company is NOT the US; companies serve to grow themselves, without regard to how they hurt or harm those around them (especially if they think they can make a profit). This is not helping the US economy; it is giving certain companies more power to exploit others around them. If they have the opportunity to make more money elsewhere, out of the US, then they will. Don’t delude yourselves into thinking that helping these private companies will help the “US Dominance”, because it won’t. Technology has never worked that way, especially if it is from a company.

In conclusion, this is a HORRIBLE idea, and you should probably consult actual experts.
