General Comment

The dominant methods used by large tech companies for training the class of attention-based neural networks that are called "large language models" require the use of massive amounts of authentic human-generated text input. Many of the companies have used copyright material without permission in the training of the current class of large language models. It would be a mistake to reward their massive lawbreaking with a retroactive permission slip - and in a rapidly changing technological environment, weakening copyright to make AI training legal will have almost immediate unintended consequences.

The Constitution purpose of copyright is to "promote the progress of science and useful arts." Regulations aimed at promoting a currently-popular style of development of large language models at the cost of weakening copyright protection for all other "sciences and useful arts" will be harmful to the original purpose of copyright, and to everyone that creates authentic and novel works of art and science.
