General Comment

While it is tempting to see AI as a magic wand to fix many of our problems, it will likely bring more problems and more expenses than savings and benefits. What people like Sam Altman are asking for is to let steal what's owned by a lot of companies that protect that sort of thing very fiercely. Not to mention all the problems and inaccuracies that AI currently deals with that would make a wide scale implementation of such software extremely dangerous for any organization or government. Just asking some of these models to do basic things like count the number of a specific letter in a word is often wrong, let alone trying to use it to replace programmers or software engineers.

Also, major corporations like Disney or Amazon would be hit by this disproportionately as their IPs and characters would be used without any compensation and could then end up be used to make money off said characters and IPs after AI had altered it. These AI companies are struggling to find more investors because every is waiting for the big returns to come in but never do. It's overhyped software that can't do much very well without major inaccuracies. These AI programs even will sometimes admit to just making up something to give you the answer you want to hear. The wrong answer could cause a case to be dismissed, or a software system to fail because an update was coded wrong. A company dealing with this would deal with angry customers. A government dealing with this could fall into crisis overnight.

If these AI companies are begging to be the one exemption to our very tight copyright and IP laws, it's clearly a sign they are failing and desperate that opening the flood gates will solve everything. It won't. It will just have more data to waste money on and continue to give incorrect or outright made up answers to questions and problems. It's a bad investment and would cost the government and countless corporations billions.
