General Comment

Artificial intelligence threatens to both optimize workflows and reinforce injustice - It is trained without consent from the producers of content, jeopardizing both copyright law and the average person's side hustles. It is trusted to make life-altering decisions, but both reinforces biases and frequently makes mistakes. What's more, it cannot be tasked with explaining its justifications, leading to a situation where humans rely on an unreliable black box to spit out results which are unpredictable, and often, entirely hallucinated by large language models. Americans cannot trust artificial intelligence without a means of culpability by its creators to source their data ethically, as well as to produce results that can be traced back to an culpable party, say if medical coverage is denied, lives are lost, or American's well-being is meaningfully affected.
