As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8b-2ovc-pabj
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-8497

Comment on FR Doc # 2025-02305

Submitter Information

Name: Stuart Wagner

Email: [REDACTED]

General Comment

It is critical that government and industry are able to develop novel capabilities within a permissive development environment directly with protected and classified data. Some ideas to accomplish this.

- 1) Sandbox environments that support untrusted software to be commingled with classified and protected data. These environments allow anything to come in, but require deep inspection to let any data or software to leave. This allows for sandboxes to bring in malware, untrusted software like Deepseek, and run it directly with protected or classified data - to learn from these capabilities and learn how effective they are in a military or intelligence context.
- 2) One day/One week clearances - provide officials in all organizations with classified data the ability to waive clearance requirements for short term projects, work, and collaborations. For example, DoD should be able to throw a one-week hackathon and with proper security protections, allow uncleared personnel temporary access to Secret information if there is a national security need to do so (such as trying their product on Secret or Top Secret data).
- 3) Automatic classification of data - Security classification guides should be written deterministically and without contradiction such that their policies can be algorithmically applied to classified and protected data. Data should similarly be automatically declassified given proper time as well. Fundamentally, machines should be increasingly involved in applying rules about the classification of data and when its ready to be declassified.

Finally one last idea is automated rules of engagement and military law analysis. The decision speed by lawyers still at times closes the window of a potential military operation to move ahead - ie a lawyer takes longer than the time window of a mission to make a decision. We should by policy increasingly be leveraging natural language processing and machine learning to increasingly automate rules of engagement interpretation during competition and war to ensure that we are not missing those windows of opportunity.
