General Comment

I am a university mathematics instructor. As an educator, it is important to me to be able to share publicly content that I create for my courses so that it can reach a broader audience. At the same time, I rely on copyright protection to retain rights and control over materials that I create. My understanding of the proposed regulation is that AI companies would be essentially exempt from following copyright law, and free to use anything I make publicly available to train AI models. If implemented, it would have a chilling effect on me and anyone else who wishes to make material of any kind that they have written available to the public. I would have to seriously reconsider what I can put on the public internet lest it be scraped by AI trainers, and would likely need to keep my course materials restricted to university servers that only my own students can log into.

I also do visual art as a hobby, and enjoy sharing my art online for the sheer joy of sharing it with others. I would also be much less able to do this if my art were more vulnerable to AI scraping. Every other artist I have discussed this issue with feels similarly, so I would also expect to be less able to enjoy others' art.

In sum, this regulation flies in the face of the principles of copyright and the rights of creators, and implementing it would seriously harm everyone's ability to share material (whether written or visual) in public.
