General Comment

Generative AI is unethical, inefficient, and frequently inaccurate. Models trained on the work of human artists and writers is plagiarism at best, and when monetized content is involved, it escalates to theft. AI strips the soul out of art of all kinds, and returns terrifying inaccurate results when used for searching - numerous articles have covered the inability of various engines to solve word problems and accurately summarize information, with some even providing downright dangerous advice about food and medicine.

Some types of machine learning have genuinely beneficial applications, but generative AI is no substitute for human creativity or critical thinking. If left unchecked, it could result in many individuals living in their own separate realities based on AI-generated "facts" with varying degrees of detrimental results.

AI cannot make judgment calls or understand the human cost or long-term effects of important or difficult decision, so it has no business being used to evaluate performance, resolve insurance claims, or draft policy.

It is entirely reasonable for the United States to aspire to be a world leader in the types of machine-learning that can have valuable scientific applications, but we cannot allow a profoundly resource-intensive plagiarism machine to dominate our society.
