

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8b-2r0u-xyz
Comments Due: March 15, 2025
Submission Type: API

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-8538

Comment on FR Doc # 2025-02305

Submitter Information

Name: James Hunter

General Comment

If the U.S. as a government body cares to keep its citizens protected from china sourcing our information, it would deny OpenAI the free reign of copyrighted material. This would allow china to more easily jump ahead in the AI race considering their open-source model. Not only is copyright protecting the american people from foreign countries, but any laws allowing private sectors to train AI would also possibly put private government data at risk, as it'd make it much easier to steal when consolidated in something that can "accidentally" be leaked to the internet. Those familiar in tech should be quite familiar with the fact that anything used on the internet can and will be compromised by bad faith actors from foreign competitors. Not to mention a loose-based operation of these AI scraping methods puts the results from the data at risk were anyone to purposely "poison" the machine learning, resulting in major set backs and untold losses from the investments made to AI.

The losses companies are experiencing already have started to become more apparent even considering that an investment is often long-term without much return for years. The unfortunate reality is that a significant amount of the population is too anti-AI for this return to ever be worth the monetary risk. If anything, AI should be trained on copyright free data and should be improved until it can no longer be recognized as AI as it can be now. Only then will it truly be worth the risk of major investments. AI is too young for any valid risk of data to foreign competitors from loosening the restrictions on online data.
