General Comment

So-called regulatory "burdens" are necessary to hold any business or industry accountable and protect the general public from exploitation. Dropping basic safeguards for the emergent AI industry, of all industries, would be incredibly reckless. US-based AI companies are already attracting billion-dollar investments, contracts, and partnerships anyway, so any failure of the US AI industry to remain competitive and profitable at this point would suggest there are deeper flaws in technology or business ventures that rely on it.

Further, if the US govt. is truly intent on protecting American jobs, then unbridled investment in AI is the wrong way to go. If we use generative AI to replace junior coders/programmers, for instance, then new programmers will no longer have a foot in the door in the tech industry; eventually, in such a case, there will be no human programmers left to replace senior programmers once they retire. This is just one example; other career paths that are similarly threatened include visual and audio effects work in film and TV, tutoring, and editing (articles, essays, etc.).
