

PUBLIC SUBMISSION

As of: March 21, 2025
Received: March 15, 2025
Status: [REDACTED]
Tracking No. m8b-2nms-7stn
Comments Due: March 15, 2025
Submission Type: Web

Docket: NSF_FRDOC_0001

Recently Posted NSF Rules and Notices.

Comment On: NSF_FRDOC_0001-3479

Request for Information: Development of an Artificial Intelligence Action Plan

Document: NSF_FRDOC_0001-DRAFT-8752

Comment on FR Doc # 2025-02305

Submitter Information

Name: Anonymous Anonymous

General Comment

A.I. developments need to be closely monitored and regulated because they are being developed without regard to existing laws of copyright and intellectual property in the interest of creating short term speculative value gains in tech stocks, despite the tremendous environmental cost, and to be used as a wedge by businesses against labor forces; or, more accurately, by investors in businesses against both the workers and the people that manage and direct the workers. The actual result of what generative A.I. companies and their boosters are billing the technology as capable of doing will be to further reduce the quality of art and creative work, as well as further perpetuate the deintellectualization of the American people, specifically through reducing critical function and other cognitive abilities through extended use - see the Microsoft-Carnegie Mellon paper quoted in this (<https://www.404media.co/microsoft-study-finds-ai-makes-human-cognition-atrophied-and-unprepared-3/>) news article.

In hand with this pursuit of endless perpetual renewable capital gains, the technology creates shortcuts to imitate the generation of art, videos, games, but is in fact just a mirage that costs tons of gigawatts of electricity (<https://www.nature.com/articles/d41586-025-00616-z>), inevitably stressing our power grid without any dividends for the tax payers. One of the core problems with these tools not being capable of what they claim to do - because they lack the human touch necessary to create novel art, for instance - is that the Emperor's New Clothes of it all requires such self-deception that companies are going to destroy themselves in order to be able to claim to shareholders that they are engaging with new technology, even when they are just using tools/creating products they already had. They are also forcing A.I. assistants and searches into all manner of technology where consumers don't want or need them, making their existing tools and products harder to use rather than easier. All of this at a time when the economic conditions make it harder for consumers to meaningfully engage the market.

But they are also, also, intending to devalue creative labor and creative products by developing a simulacra or approximation of genuine art for long enough to suppress the workers in the industries to the extent that they can kill industries and creative communities that they cannot replace. This is not merely a matter of people taking a payout; it will be a matter of people doing *something else*; that is to say that we are going to lose a generation, maybe generations, of great American art from American artists about American experiences in the interest of chasing investment dollars. Aside from the terrible effect this will have on American prestige and American culture, it is also going to be symptomatic of the other, related idea... A.I. is being billed as removing labor from the process of generating wealth. However, you still need customers. If no one has a job because there job has been automated by a machine that costs more to do it, who is going to buy the products? Any products; not just tech products and art products, but basic goods and services?

Moreover, this is a huge BUBBLE. Probably worse than the dotcom bubble, probably like the real estate bubble. So many tech companies are over-leveraged into a business pursuit with poor basic market fundamentals. Ed Zitron has been writing about this for months (<https://www.wheresyoured.at/saaspocalypse-now/>). Lots of major American firms in the tech sector are vulnerable to volatility in the value of their companies because they are investing in something without a clear profit outlay. The U.S. federal government tying itself to these pursuits in the interest of military or surveillance applications may buoy a few of these companies, but it may also just drag the federal deficit into a tailspin anchored by a collapsing economy.
