General Comment

After reviewing the proposal, I just want to point out one loophole that alone demonstrates what a bad idea this is.

I can take illegally obtained data, say data from SpaceX on building rockets including full computer data, software, mechanical data, and so forth. I can then run it through a large language model, and suddenly that data is no longer illegally obtained - it's "part of a LLM data set" now, and with this proposal there are no protections provided for the legal owners of the data that was used by a LLM for any purpose (such as training).

I can then take this very specifically trained LLM and use it to not only build my own, with no legal recourse available to SpaceX, but I can also search it for vulnerabilities USING THE LLM-TRAINED AI, and seek to harm SpaceX.

Now imagine I'm China. And you made all of this legal for me.

LLM training data must be extremely legislated, painfully so, in order to prevent any improper use of secrets. This would do the exact opposite. Could this "harm" companies trying to get rich off this terrible technology? Yep, it sure could. But that's a necessary evil to prevent far worse from being done with the data. Like China building a bunch of SpaceX rocket knock-offs using the stolen engineering using American AI technology.
