General Comment

If private sector AI innovations were "hampered" by regulations preventing them from utilizing American-produced, copy-protected content in their training, then these innovations are worthless, and cannot lead to a "brighter future for all Americans"; rather they only hurt the American workforce by their theft and redistribution of said IP. "AI superiority" means nothing if its net effect on our nation is harm. (And the power and resource requirements of generative AI already do massive harm to our country in the form of energy waste, material / e-waste, consumption of potable water, and noise pollution from data centers.)

These so-called "AI" have no—and cannot have any—true understanding, and they produce erroneous results for an egregious percentage of their output. Relying on them for key portions of our national infrastructure such as defense and security, governance, or education is to invite disaster. Worse still (and as the cynic in me suspects is rather the point), it would be disaster without any accountability.

Perhaps there is a future in which AI has some place, and it should continue to be developed in research facilities. But if we implement it as it is now, and as it looks to be for the foreseeable future, we will only be harming the American people, the American economy, or the security of our Nation.

I urge nothing but extreme skepticism towards implementation until such a time as the technology has been proven to produce worthwhile (not merely "good enough") results, and can do so without theft from our citizens and without harm to our ecology and economy.

Thank you.
